

Average of Salary_LPA by Gender

Average of Salary_LPA by College_Tier

Graph 1 (Average of Salary_LPA by Gender)

Insights:

1. The average salary package is almost identical across Male, Female, and Other gender categories, with all groups averaging around 12.4 LPA.
2. No gender category demonstrates a significant advantage in terms of salary outcomes.
3. The minimal variation suggests that gender has little to no impact on salary distribution within this dataset.
4. Salary opportunities appear to be distributed fairly equally among all gender groups.
5. Other factors such as technical skills, internships, projects, certifications, and academic performance are likely to have a greater influence on salary than gender.

Graph 2 (Average of Salary_LPA by College_Tier)

Insights:

1. The average salary package remains nearly the same across Tier 1, Tier 2, and Tier 3 colleges, with an average close to 12.4 LPA.
2. Surprisingly, no college tier shows a substantial salary advantage over the others.
3. The negligible differences indicate that college tier alone is not a strong determinant of salary in this dataset.
4. Students from all college tiers appear to have comparable placement outcomes.
5. This trend suggests that individual factors such as skills, internship experience, certifications, and project work may be more important than college tier in determining salary packages.

Graph (Average of Salary_LPA by Specialization)

Insights:

1. The average salary package remains almost identical across all specializations, including Computer Science, Data Science, Mechanical, AI/ML, Electronics, Information Technology, and Civil Engineering.
2. No specialization stands out as having a significantly higher or lower average salary compared to the others.
3. The minimal variation in salary suggests that specialization alone is not a major factor influencing salary outcomes in this dataset.
4. Students from both technical and non-technical branches appear to achieve comparable salary packages.
5. The uniform salary distribution indicates that factors such as AI/ML skills, internships, certifications, projects, coding proficiency, and communication skills may play a more significant role in determining placement packages than academic specialization.

Average of Salary_LPA by Internships

Graph 1 (Average of Salary_LPA by Internships)

Insights:

1. Students with 4 internships have the highest average salary package, contributing approximately 22.35% of the total distribution.
2. The average salary tends to increase as the number of internships increases, indicating a positive relationship between internship experience and placement packages.
3. Students with 3 internships also achieve strong salary outcomes, accounting for around 21.01% of the distribution.
4. Candidates with 0 or 1 internship receive comparatively lower average salary packages, highlighting the importance of practical industry exposure.
5. The results suggest that internship experience is a valuable factor in improving employability and securing higher-paying job opportunities.

Graph 2 (Average of Salary_LPA by AI_ML_Skill_Level)

Insights:

1. Students with an AI/ML Skill Level of 10 achieve the highest average salary package, contributing approximately 11.11% of the total distribution.
2. Average salary generally increases as AI/ML skill levels improve, indicating that stronger technical expertise is rewarded in the job market.
3. Candidates with skill levels 8, 9, and 10 consistently demonstrate higher salary outcomes compared to lower skill levels.
4. Students with lower AI/ML skill levels (1–3) contribute the smallest share of average salary, suggesting a skill gap impact on compensation.
5. The relatively balanced distribution across skill levels indicates that while AI/ML expertise influences salary, other factors such as internships, projects, communication skills, and academic performance also play important roles.

Average of Salary_LPA by AI_ML_Skill_Level

Graph 1 (Average of Salary_LPA by Aptitude_Test_Score)

Insights:

1. The average salary package remains relatively stable across different aptitude test scores, fluctuating around 12–13 LPA.
2. Candidates with higher aptitude scores do not show a significantly higher average salary compared to those with moderate scores.
3. The minimal variation in salary suggests that aptitude test performance alone is not a strong predictor of salary outcomes in this dataset.
4. Salary packages remain consistent throughout the score range, indicating that employers may evaluate candidates using multiple factors beyond aptitude scores.
5. Skills, internships, projects, certifications, and practical experience are likely to have a greater impact on salary than aptitude test scores alone.

Average of DSA_Problems_Solved by College_Tier

Average of Salary_LPA by Projects_Count

Graph 2 (Average of DSA_Problems_Solved by College_Tier)

Insights:

1. Students from Tier 3 colleges have the highest average number of DSA problems solved, with a value slightly above 250 problems.
2. Tier 1 and Tier 2 colleges show nearly identical averages, indicating similar levels of coding practice among students.
3. The difference in DSA problem-solving counts across college tiers is very small, suggesting that coding practice is not heavily dependent on college tier.
4. Students from all college tiers demonstrate a strong engagement with DSA preparation, averaging around 250+ solved problems.
5. The results indicate that individual effort and consistent practice may play a more important role in DSA proficiency than the college tier itself.

Graph (Average of Salary_LPA by Projects_Count)

Insights:

1. The average salary remains almost the same across all project counts.
2. Students with more projects do not show a significant increase in average salary.
3. The salary values stay around 12–13 LPA for all project categories.
4. The graph suggests a weak relationship between the number of projects and salary package.
5. Other factors such as skills, internships, and interview performance may have a greater impact on salary than project

Graph (Average of Salary_LPA by CGPA)

Insights:

1. The graph shows a positive relationship between CGPA and Salary_LPA.
2. Students with higher CGPA generally receive higher salary packages.
3. Salary increases steadily as CGPA rises from around 4.5 to 10.
4. Students with a CGPA above 8.5 tend to earn higher salaries compared to those with lower CGPA.
5. Overall, CGPA appears to be an important factor influencing salary outcomes in this dataset.

Graph (Average of AI_ML_Skill_Level by Specialization)

Insights:

1. Students from the AI/ML specialization have the highest average AI/ML skill level among all specializations.
2. The average AI/ML skill levels are very similar across different specializations, with only small differences observed.
3. Computer Science, Data Science, and Information Technology students show strong AI/ML skill levels comparable to AI/ML students.
4. Students from non-technical branches such as Mechanical and Civil Engineering also demonstrate a good level of AI/ML skills.
5. The graph suggests that AI/ML knowledge is being adopted across multiple disciplines and is not limited to a single specialization.

Average of Salary_LPA by Mock_Interview_Score

Graph (Salary_LPA vs Mock_Interview_Score)

Insights:

1. Students with higher mock interview scores generally tend to receive higher salary packages.
2. There is a positive relationship between mock interview performance and placement outcomes.
3. Candidates with strong interview skills are more likely to secure better job offers.
4. Mock interview scores can be a useful indicator of placement readiness and communication ability.
5. The graph suggests that improving interview performance may help students increase their chances of obtaining higher salary packages.
